ABSTRACT OF THE DISCLOSURE

Generators for use with a fossil fuel- and electric-powered vehicle having a plurality of different types of generator units mounted on a vehicle to supplement the power supply of the vehicle. Propeller generator units and turbine generator units utilize the force of oncoming wind to output electricity. The rolling wheel generator units consist of installing an additional fifth wheel, sixth wheel, seventh wheel, and eighth wheel of a dedicated generator roller wheel set on any of the main wheel axles disposed on the vehicle undercarriage such that by circumvolution around the axle when the vehicle is proceeding forward, the additionally installed generator roller wheel set rotates generators to produce electricity. A matching rectifier center caches the electric power produced by each generator unit and, following accumulation, directly supplies electricity to the vehicle or recharges its storage battery.
